<https://www.linkedin.com/in/vikram-nadathur-500641114/>

Seeking a software development position to apply my design and programming skills to, meaningfully contribute towards impactful solutions for challenging problems, through dedication and teamwork. Aiming to advance myself technologically and grow in this process.

Education:

B.S Computer Science, Minor: Mathematical Sciences Graduation in May 2027

Kean University, Union NJ

A.S Computer Science Completed 2024

Middlesex College, Edison NJ

(Relevant Coursework: Java, Python, Statistics, Information Security)

GPA:3.57, Graduated with High Honors, Dean's List

Certifications:

- CS50 Introduction to Computer Science Anticipated May 2025
Harvard University Online
(C programming language used)
- Introduction to Git Completed in Feb 2025
Datacamp
- Bits and Bytes of Computer Networking Completed in Aug 2024
Google Certificate

Programming Projects:

- Implemented the Tideman voting method (also known as “ranked pairs”) is a ranked choice voting method that’s guaranteed to produce the Condorcet winner of the election if one exists using C programming language.
- Implemented image manipulation program to apply filters such as blur, reflect, grayscale and sepia on BMP images using C programming language.

Get Me Gas — iOS/Android Mobile App | React Native, Expo, FastAPI, MongoDB, Google Cloud Run | *Mar 2026 – Present*

- Designed and shipped a full-stack mobile app (React Native/Expo) that surfaces the cheapest nearby gas stations by fuel grade (regular, midgrade, premium, diesel), using live geolocation and the Google Places API.
- Built an async FastAPI backend (Motor/MongoDB) that geocodes, price-parses, and ranks 10+ stations per request by price and distance, with bulk MongoDB writes for caching and reduced API load.
- Cut backend hosting costs to \$0/month by migrating the service and database off a \$46/month Railway + paid MongoDB cluster onto Google Cloud Run and MongoDB Atlas free tier, with zero-downtime cutover and CI/CD auto-deploy from GitHub.
- Implemented a freemium monetization model using in-app purchases (expo-iap) to unlock premium station amenity data, and wrote an automated API test suite covering all backend endpoints.

AI Digital Twin — Conversational Career Agent | Python, OpenAI API, xAI Grok, Gradio

Sept 17 2026 – present

- Designed a two-model guardrail pipeline in which a second LLM (xAI Grok) reviews every generated response for professionalism and discrimination risk, automatically triggering a self-correcting regeneration loop until the response passes.
- Implemented OpenAI function calling with custom tools that capture visitor contact information and log unanswerable questions, sending real-time push notifications through the Pushover API so no lead is missed.
- Engineered a structured system prompt enforcing persona consistency, scope control, and explicit refusal when information is absent from context, reducing hallucinated claims about my experience.
